

DOES YOUR CHILD EXPERIENCE BED-WETTING OR NOCTURNAL ENURESIS?

Bed-wetting or nocturnal enuresis can occur in up to 20% of school-aged children over 5 years of age. As it can be psychologically stressful and socially disruptive for the child, it can impact on the child's self-esteem.

Clinical Trial for Nocturnal Enuresis

A variety of treatments (Alarm therapy, pharmacotherapy, bladder training, rewards, limiting fluid intake) have been partially effective as relapse of symptoms can occur. This clinical trial will measure how effective a specific combination herbal capsule is at reducing episodes of bed wetting.

Who we are seeking?

We are seeking children aged between 6-14 years old with bedwetting issues to trial a TGA listed herbal treatment that has been shown to be effective in improving bladder tone and control.

Information about the clinical trial

Once your child is screened as eligible, you and they will be invited to make an appointment with the researchers at the Endeavour College of Natural Health, Level 2, 815/825 George St, Haymarket, NSW 2000. Participation in the trial will include 3 clinic visits to the College over 8 weeks, followed by a 6 month Follow up period (phone-calls) to determine how effective the capsule is in reducing or stopping the symptoms. A participant diary will be completed by you / your child daily for the duration of the trial.

Further information

For further information the Patient Information Sheet, please contact Dr Janet Schloss.
